1

2

- 1. (Original) A suspension assembly including a load beam and a flexure 2 supporting a slider, said flexure comprising: 3 a first supporting area connected to said load beam on a leading end side: 4 a second supporting area connected to said load beam on a supporting end side; 5 a flexure tongue provided with a supporting area of said slider, a dimple contact 6 point, and a leading edge; 7 a metal layer including: a first loop spring structure extending from said first supporting area so as 8 9 to support said flexure tongue and having a parameter for giving stiffness to said flexure 10 tongue; and 11 a second loop spring structure extending from said second supporting area 12 so as to support said flexure tongue and having a parameter for giving stiffness to said flexure tongue, a value of said parameter being selected in such a manner that said second 13 loop spring structure gives a stiffness smaller than the stiffness said first loop spring 14 15 structure gives to said flexure tongue; and a wiring layer laminated on said metal layer in said second supporting area 16 17 and extendedly branching from said second supporting area toward said slider.
 - 2. (Original) The suspension assembly according to claim 1, wherein said first loop spring structure and said second loop spring structure constitute a pair of strip-shaped arms each formed of the metal layer.
 - 3. (Original) The suspension assembly according to claim 2, wherein each of said parameters of said first and second loop spring structures is selected as one or a combination
